

## **Scenario-Based Question: Importing and Appending Data in Power BI**

Online food delivery company Somato has provided Peter Pandey with a monthly report of order data in the form of CSV files. Each file represents order data for a different month but contains the same column structure.

**You have the following three CSV files in the Sales\_Data folder:**

**Sales\_January.csv**

**Sales\_February.csv**

**Sales\_March.csv**

Each CSV file has the following columns:

**order\_id, orderDate, customer\_id, Resturant\_ID, Fooditem, quantity, deliver\_status, payment\_method**

Peter Pandey has been tasked with creating a Power BI report that shows the cumulative order data for the first quarter of the year.

### **Question:**

Using Power BI, how would you import and append these CSV files to create a single dataset for analysis? Outline the steps you would take to accomplish this task, from importing the data to appending the files together.
